

FINNISH ORGANIC RESEARCH INSTITUTE

Research-based information about organics

The Finnish Organic Research Institute (FORI)

- Is a multidisciplinary research and expert network that operates under the auspices of the University of Helsinki and the Natural Resources Institute Finland (Luke).
- Conducts research to produce information about organics **for the business sector, consumers and society**.
- Promotes organic food production and consumption throughout the Finnish food chain through research, education and development projects.

Our vision

is to be an internationally acknowledged expert in the sustainable food chain and a desired cooperation partner.

Main fields of research in FORI

Organic primary production

In research into primary production we answer questions about organic plant and animal production and wild-collection products from organic-certified collection areas. The effectiveness of organic production, the development of production methods and the quality of organic products are the main subjects of this research theme.

Organic production and the environment

Research into organic production and the environment focuses on finding ways to reduce the environmental load from agriculture to a level that is ecologically sustainable. The research aims to develop fair food systems that support nutrient recycling, protect the environment and maintain biodiversity.

Organic food and nutrition

Questions about the quality and processing of organic food are being examined in research into organic food and nutrition. Our research also focuses on sustainable diets and the health and nutrition effects of organic food.

Organics in society and on the market

This research theme focuses on the position of organics in society, on the market and in consumers' choices. Themes about the profitability of the organic food business and its development are also exposed in this research section.

Our mission
is to promote the sustainability
of the food system through
quality research into organics.
